

What is "measurable disease" and why is it important?

The screenshot shows a web browser window displaying the metastatic website. The page title is "Measurable disease" with a help icon. The question is "Are any of your tumors measurable?" with a subtext: "For accurate matching, we suggest you consult with your provider." There are three radio button options: "Yes, I have measurable disease", "No, I do not have measurable disease", and "Unsure, or show all trials for measurable and non-measurable disease". The "Unsure" option is selected. Below the options are "BACK" and "NEXT" buttons, and a "Skip to Trials" link. The footer includes "Powered by: BreastCancerTrials.org find a trial that's right for you", "Sponsors & Partners", and "Concerned about your privacy?"

- "Measurable disease" refers to tumors that can be measured.
- This information is then used to determine if a treatment is working.
- Having at least one measurable tumor is a common requirement for trial participation.

For the most accurate trial results, we recommend you consult with your doctor to determine if your tumors are measurable or not measurable.
